

Flattening turns a nested record into rows and columns

Nested JSON as stored

```
{
  "asset_id": "AHU-3",
  "location": {
    "building": "Link Hall",
    "floor": 2
  },
  "filters": [
    {"stage": 1, "type": "MERV8"},
    {"stage": 2, "type": "MERV13"}
  ]
}
```

After json_normalize with record_path

stage	type	asset_id	location.building
1	MERV8	AHU-3	Link Hall
2	MERV13	AHU-3	Link Hall

record_path picks the repeating list;
meta carries the parent fields down to every row.

One asset, two filters, two levels of nesting.
