

Python Control Flow

Making Decisions and Repeating Tasks

1. Conditional Statements (`if`, `elif`, `else`)

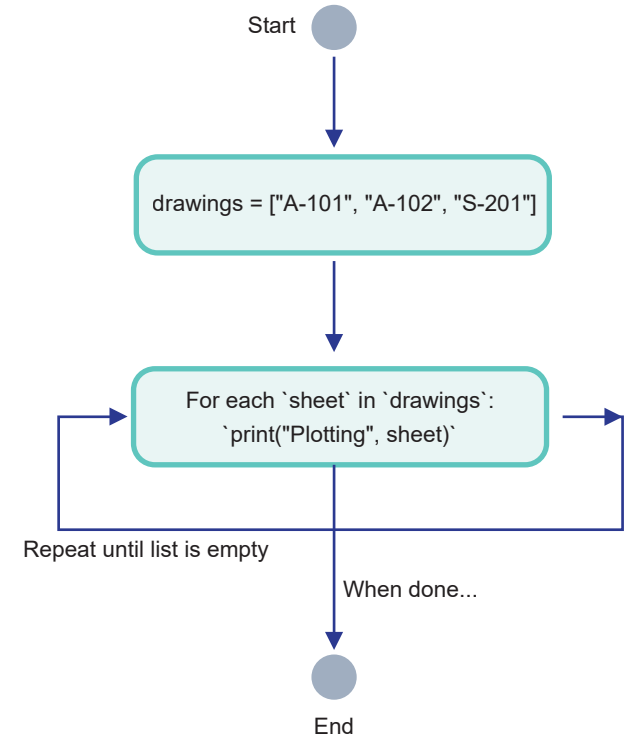

Code that runs only when a certain condition is met.

```
zone = "Commercial"
if zone == "Residential": height_limit = 35
elif zone == "Commercial": height_limit = 100
else: height_limit = 50
```

2. Loops (`for`)

Repeating an action for each item in a collection.

```
drawings = ["A-101", "A-102", "S-201"]
for sheet in drawings:
    printf("Now plotting sheet: {sheet}")
# Output will print for each sheet
```
