

Boolean Literals

In programming, a boolean literal is simply a value that can only be one of two things: True or False. Think of it like a light switch—it's either ON or OFF.

Booleans are used to make decisions in code:

```
# Assigning boolean literals to variables
is_daytime = True
is_raining = False

# Using booleans in an if statement
if is_daytime:
    print("Let's go outside!")
else:
    print("It's night, time to rest.")
```
